

AI-THON 2025

TEAM DOT

CHALLENGE

Leverage AI to get rid of legacy systems using shared codebase and relevant documentation.

PROBLEM STATEMENTS

- Sunset legacy Incident Management tool
- AI enabled toolkit to extract business logic and workflows from existing BL CRM
- To transition the contract prolongation from eCare/OMS-OE to MAPIs using AI enabled solution

EXPECTED OUTCOME

- Comprehensive understanding of legacy sys
- AI-generated visual & structured artifacts
- Foundation to guide migration to a modern platform or microservice architecture

EVALUATION CRITERIA

- Use of GenAI in code and doc understanding
- Accuracy of logic extraction
- Clarity of visual and structured artifacts
- Innovation in approach and automation

SUMMARY

Leverage AI to sunset an incident management tool while performing architecture analysis and providing relevant solution including transition of existing incidents to new platform.

[SKS – WMS]

Develop an AI-driven toolkit to decode and extract business logic from BL CRM's legacy codebase & documentation. Map it intelligently into the MAPI world architecture to fast-track system decommissioning and transformation.

[BL - CRM]

Develop AI-powered transformation solution to enable contract prolongation without eCare/OMS-OE and empowering micro service architecture (MAPIs)

[E-CARE]

BACKGROUND

The focus is to sunset SKS WMS, a legacy platform for incident management built on top BKC Remedy which is projected to be depreciated by 2027. The plan is to transition to Camunda or other Saas/DPS.

TARGET AUDIENCE

Front line support team, Customer success agents

BIG ENOUGH TO MATTER

Revamp the end to end solution while migrating existing 278.00 incidents currently logged; and decommission the platform while enhancing customer experience.

CHALLENGE

- Develop a trouble ticket management solution easily configurable UI and with option of creating no-code workflows while being flexible enough to be engaged with self-service modules (internal or external).

EXPECTED OUTCOME

- Complete analysis of existing architecture and business process
- Defining the dependencies and transition plan to MAPIs

BACKGROUND

We are steadily decommissioning the **BL-CRM** stack (TCK, PESA, LOM, ...) in favour of micro-services that expose the corporate **Magenta-API (MAPI)** standard. To avoid a “big-bang” cut-over, we’re building **MAPI Maestro - a thin compatibility layer**.

TARGET AUDIENCE

Migration architects, Maestro developers, and any team responsible for retirements of legacy services.

BIG ENOUGH TO MATTER

Codifying the analysis will slash migration time, expose hidden business rules early, and let us sunset legacy components without breaking downstream systems.

CHALLENGE

- Develop an **analysis toolkit** that helps an engineer derive everything needed to build the corresponding MAPI Maestro wrapper.

EXPECTED OUTCOME

- Understand the legacy service (business logics, workflows, and field level mapping)
- Map to MAPI capabilities
- Produce deliverables (manual, semi-automated, or automated)

BACKGROUND

eCare is an existing legacy platform that enables mobile contract prolongation by bridging multiple consumers. The target is to transform the journey from eCare while empowering MAPIs to communicate with consumers.

TARGET AUDIENCE

Migration architects, developers, and any team responsible for retirements of legacy services.

BIG ENOUGH TO MATTER

- Deutsche Telekom manages millions of customer contracts across mobile and broadband.
- Incumbent solution is based on the monolith/ service oriented legacy solution to micro service (MAPI inclined) solution

CHALLENGE

- Develop a comprehensive toolkit to analyse the existing eCare codebase to understand contract prolongation journey using AI, enabling the MAPIs to seamlessly interact with current consumers and maintain backward compatibility.

EXPECTED OUTCOME

- Understand the business logics, architecture & dependencies
- Understand the MAPI capabilities & required upgrades
- Produce deliverables
